

Day-1:

Create Your Salesforce Developer Org To Get Started

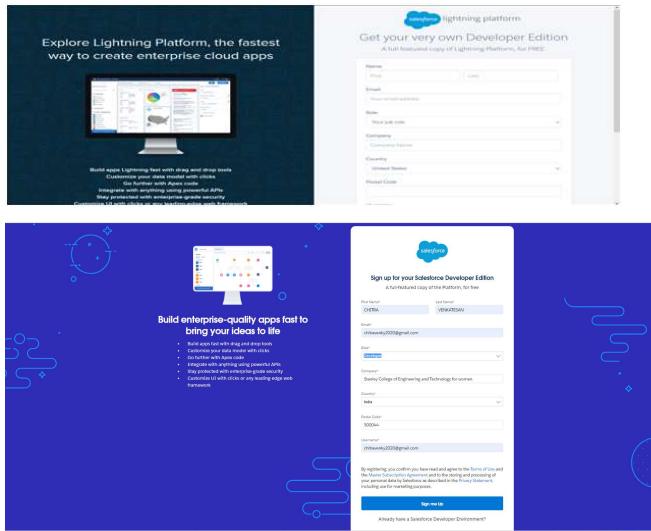

Creating a developer org in salesforce.

1. Go to developers.salesforce.com/
2. Click on sign up.
3. On the sign up form, enter the following details :
 1. First name & Last name
 2. Email
 3. Role : Developer
 4. Company : College Name
 5. County : India
 6. Postal Code : pin code
 7. Username : should be a combination of your name and company

This need not be an actual email id, you can give anything in the format :

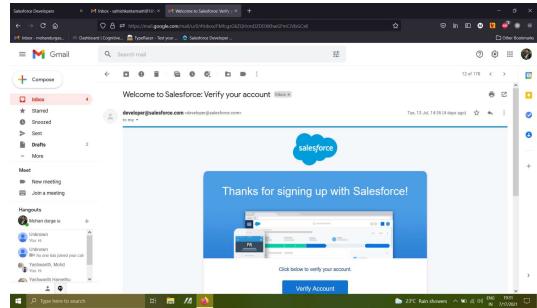

username@organization.com

Click on sign up after filling these.

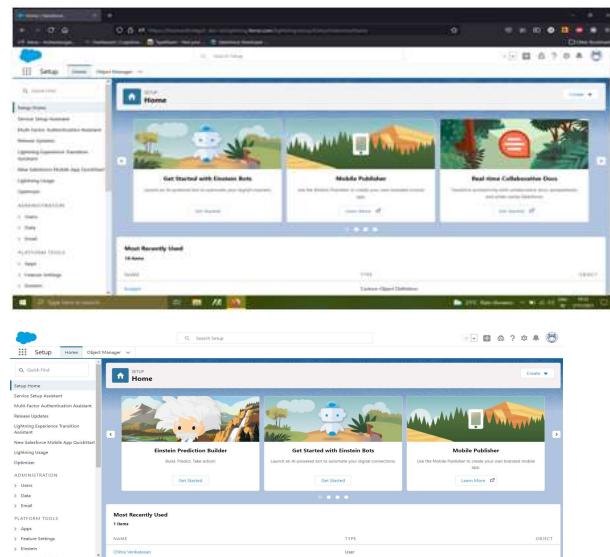

Account Activation

Go to the inbox of the email that you used while signing up. Click on the verify account to activate your account. The email may take 5-10mins, as allocating a developer org will take time.

Login To Your Salesforce Account

1. Go to salesforce.com and click on login.
2. Enter the username and password that you just created.
3. After login this is the home page which you will see.

Day 2:

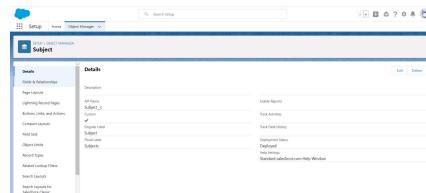

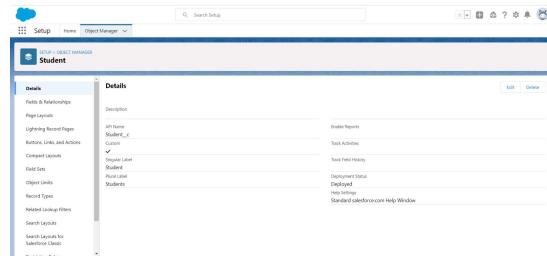

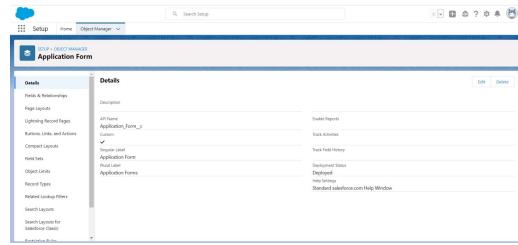

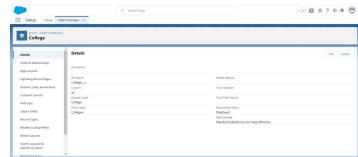

1. (i)Custom Object Creation:

Custom Objects: Custom objects are the objects which are created manually by the users.

Create The Custom Objects For The Application

Create the following Custom Objects For the Application.

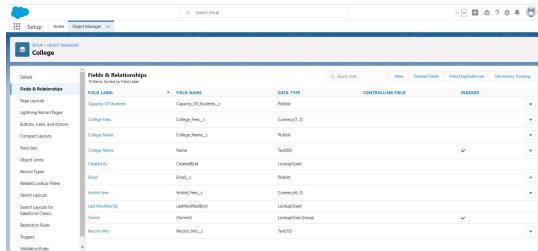

1. College
2. Application Form.
3. Students.
4. Subjects.

(ii)Create Fields On College Object

Create the following fields on the college object.

Field Name	Data Type	Required	Values
Record Info	Text		
College Fees	Currency(7,2)	Yes	
Hostel Fees	Currency(6,2)	Yes	
College Name	Picklist(Refer Business Logic In Milestones)	Yes	
Email	Picklist		blr@mit.co.in hyd@mit.co.in mum@mit.co.in maa@mit.co.in ccu@mit.co.in del@mit.co.in
Capacity Of Students	Picklist		500-1000, 1000-2500, 2500-6000, 6000-10000

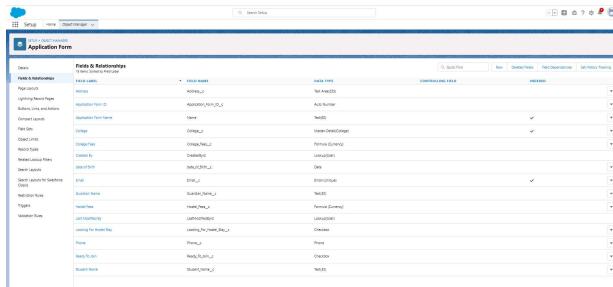

(iii)Create Fields On Application Form Object

Create the following fields on the application form object.

Field Name	Data Type	Required	Values
Application Form ID	Auto number		F-{000000} Starting Number=1
Address	Text(255)	Yes	
College	Master-Detail(College)	Yes	

College Fees	Formula(Currency)		
Hostel Fees	Formula(Currency)		
date of Birth	Date	Yes	
Email	Email(Unique)	Yes	
Guardian Name	Text(30)	Yes	
Looking For Hostel Stay	Checkbox(default=Uncheck)		
Ready To Join	Checkbox(default=Uncheck)		
Student Name	Text(30)	Yes	
Phone	Phone	Yes	

(iv) Create Fields On Student Object

Create the following fields on the student object.

Field Name	Data Type	Required	Values
Student Name	Text		
Address	Text(255)	Yes	
Application Form	Lookup(Application Form)		
College Name	Formula(Text)		
Date Of Birth	Date	Yes	
Guardian Name	Text(30)	Yes	
Phone	Phone	Yes	

(v)Create Fields On Subject Object

Create the following fields On the Subject object.

Field Name	Data Type	Required	Values
Subject ID	AutoNumber		S-{000000} Starting Number=1
Paper 1	Picklist(Refer Business Logic Milestone)		
Paper2	Picklist(Refer Business logic Milestone)		
Student	Lookup(Student)		

2.Adding Business Logic To Application

(i)Creating Global Picklist Value Sets

1. Create the following global picklist value sets for the application.

a)College

Picklist Value	Values
----------------	--------

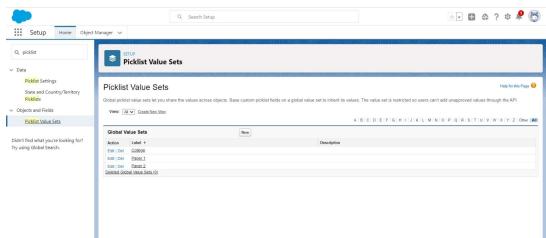

Name	
College	MIT-HYD MIT-BLR MIT- MUM MIT-MAA MIT-DEL MIT-CCU

b)Paper1

Picklist Value Name	Values
Paper 1	APEX JAVA C C++

c)Paper2

Picklist Value Name	Values
Paper2	MATHEMATICS ENGLISH STATISTICS

(ii)Creating Field Dependencies

1. Create field dependency between college Name and Email, where the controlling field is college Name and dependent field is Email. Select the email ids according to the college names.

The top screenshot displays the 'College Field Dependencies' page. It includes a table with columns for Action, Controlling Field (set to 'College Name'), Dependent Field (set to 'Capacity Of Students'), and Modified By. The bottom screenshot shows the 'Edit Field Dependency' page, which provides a detailed view of the selected dependency. It includes instructions for selecting values and a large table showing all possible combinations of College Name and Capacity Of Students.

2. Create field dependency between college Name and capacity of students, where the controlling field is college Name and dependent field is Capacity of Students. Select the values according to your wish.

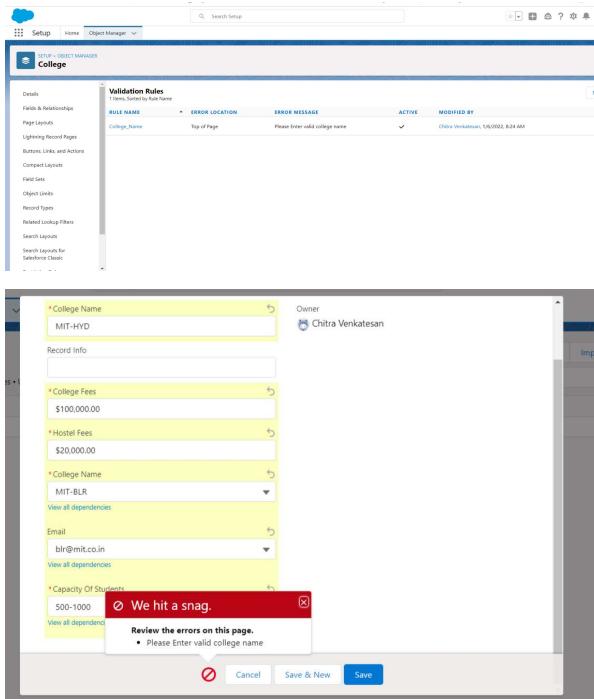

The top screenshot displays the 'College Field Dependencies' page. It includes a table with columns for Action, Controlling Field (set to 'College Name'), Dependent Field (set to 'Capacity Of Students'), and Modified By. The bottom screenshot shows the 'Edit Field Dependency' page, which provides a detailed view of the selected dependency. It includes instructions for selecting values and a large table showing all possible combinations of College Name and Capacity Of Students.

Day 3:

(iii) Create Validation Rule On College Object

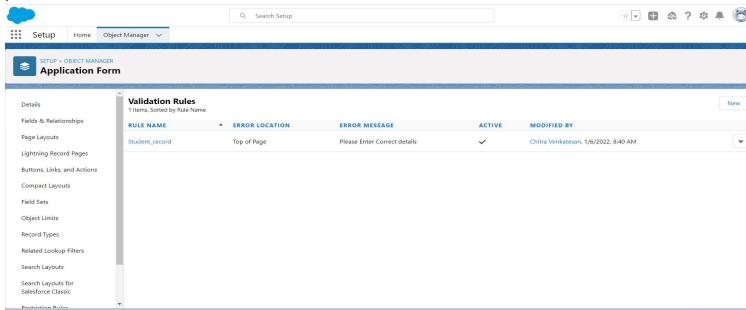

1. Create a validation rule such that the college name and record info should have the same name.

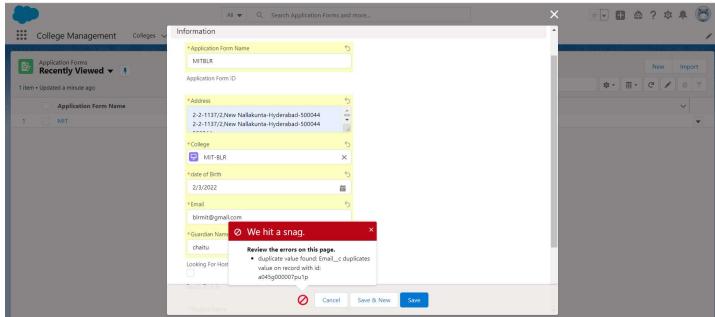

TEXT(College_Name_c) <> Name

2.. Create a validation rule on the application form object to stop any modification on the application form once a student record is created.

```
AND(Ready_To_Join__c==true,
OR(
ISCHANGED(Address__c),
ISCHANGED(College__c),
ISCHANGED(DateOfBirth__c),
ISCHANGED(Email__c),
ISCHANGED(GuardianName__c),
ISCHANGED(Phone__c)
)
)
```

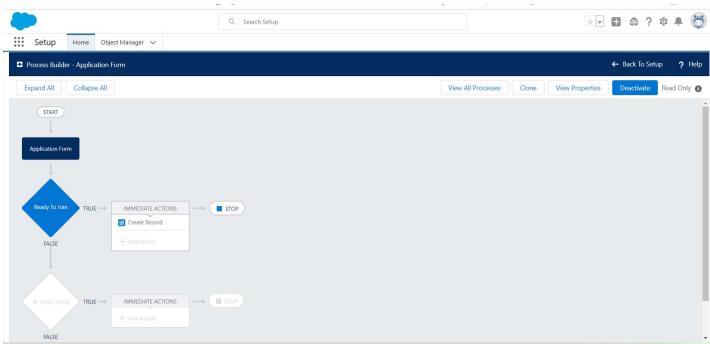

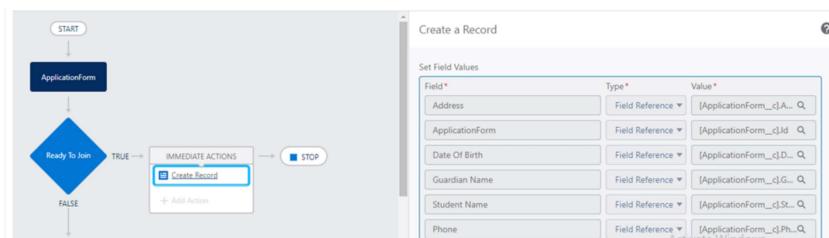

Day 4:

(iv) Process Automation

1. Create an automation process such that when the "ready to join" field is checked on the application form object we need to create the student record automatically with the information specified in the application form record.
2. Go to Setup -> select "Process Builder" from quick find. Create a Process Builder on the "Application Form" object with a condition as "When a record change". And select "When a record is created or edited".
 - a. In the diamond shape box(called nodes), select the criteria which trigger the Process builder to fire. In our example, it is "When Ready_to_join field is checked."
 - b. Once the node is setup, click on the adjacent box called "Immediate action". And select create a record on the student object. Please follow the below screenshot.

Create a Record

Record Type*
Student

Set Field Values

Field*	Type*	Value*
Address	Field Reference	[Application_Form__c].A... Q
Date Of Birth	Field Reference	[Application_Form__c].d... Q
Guardian Name	Field Reference	[Application_Form__c].G... Q
Phone	Field Reference	[Application_Form__c].P... Q
Students Name	Field Reference	[Application_Form__c].S... Q
Application Form	Field Reference	[Application_Form__c].Id Q

Save **Cancel**

Day 5:

Create The Student Record Using Flow:

1. First deactivate the process builder which we created earlier.
2. Now search for flows and select new flow ->record triggered flow
3. For object select application form, in configure trigger select when the record is updated for entry criteria select as ready to join equals to true.
4. Now create a variable named student in the resource section.
5. Now add the assignment as follows.

Edit Assignment

Assign student record data (Assign_student_record_data) ↗

Set Variable Values

Each variable is modified by the operator and value combination.

Variable	Operator	Value
Aa studentVar > Address	Equals	Aa \$Record > Address
Aa studentVar > Application Form	Equals	Aa \$Record > Record ID
Aa studentVar > college Name	Equals	Aa \$Record > College
Aa studentVar > Date of Birth	Equals	Aa \$Record > Date of Birth
Aa studentVar > Guardian Name	Equals	Aa \$Record > Guardian Name
Aa studentVar > Phone	Equals	Aa \$Record > Phone
Aa studentVar > Student Name	Equals	Aa \$Record > Student Name

6. Now add create records.

The screenshots illustrate the configuration of a flow. The first screenshot shows the 'Configure Start' dialog where an entry condition is set to trigger the flow when a specific lead record is updated. The second screenshot shows the 'New Assignment' dialog where assignments are made for various fields like Address, Application Form, College Name, Date of Birth, and Student Name. The third screenshot shows the flow canvas with a 'Start Record-Triggered Flow' step, an 'Assignment' step (with the same assignments), and a 'Create Records' step.

Day 6:

Create A Batchapex For Application Form

1. From the developer console create a new apex class and enter the following code.

```
public class ApplicationBatchTest implements Database.Batchable<sobject> {
    public Integer totalForms = 0;
    public Integer totalConvertedforms = 0;
    public Database.QueryLocator start(Database.BatchableContext bc){
        // gathers the data for you
    }
}
```

```

String applicationQuery= 'select id, name, Ready_to_join_c from Application_Form__c';
return Database.getQueryLocator(applicationQuery);
}
public void execute(Database.BatchableContext bc, List<Application_Form__c> formList){
    // process the data
    for(Application_Form__c af : formList) {
        totalForms++;
        if(af.Ready_to_Join__c){
            totalConvertedForms++;
        }
    }
}
public void finish(Database.BatchableContext bc){
    Messaging.SingleEmailMessage mail = new Messaging.SingleEmailMessage();
    // address, sveject, content aata to sent to animi.
    mail.setSubject('Application from and student recond data as of today ');
    mail.setPlainTextBody('Totel no of application form records are : ' +totalForms+ ' out of
which no of students as per today : ' +totalConvertedForms);
    String[] emailAddess = new String[]{chitravenky2020@gmail.com};
    mail.setToAddresses(emailAddess);
    Messaging.sendEmail(new Messaging.SingleEmailMessage[] { mail });
}

}
}

```

Create A Schedular Class

- From the developer console create a new apex class and enter the following code.

```

public class applicationschedule implements Schedulable{
    public void execute(SchedulableContext sc){

```

```

ApplicationBatchTest abt = new ApplicationBatchTest();

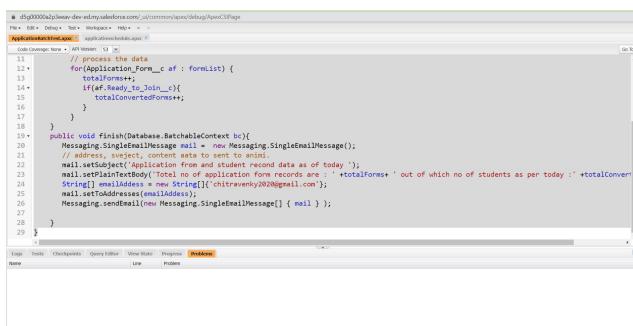

Database.executeBatch(abt, 400); // 200 to 2000

}

}

```

From setup search for apex class and click on schedule jobs and fill the details as per your requirements

The screenshot shows the Salesforce developer console with the code for the ApplicationBatchTest class. The code is as follows:

```

11    * process the data
12    * @param formList : List<Application_form__c>
13    * @return integer
14    *
15    * This method processes the application form data
16    * and sends an email to the student record
17    */
18    public void processTheData(List<Application_form__c> formList) {
19        Integer totalForms = 0;
20        Integer totalConvertedForms = 0;
21        for(Application_form__c af : formList) {
22            if(af.Need_In_Join__c){
23                totalConvertedForms++;
24            }
25            totalForms++;
26        }
27    }
28 }

public void finish(Database.BatchableContext bc){
29     Messaging.SingleEmailMessage mail = new Messaging.SingleEmailMessage();
30     //address, subject, content etc to sent to admin
31     mail.setSubject('Application Form and student record data as of today');
32     mail.setPlainText('Total no of application form Records are : '+totalForms+' out of which no of students as per today : '+totalConvertedForms);
33     String[] emialAddreses = String.valueOf(chitravency20@gmail.com).split(',');
34     mail.setToAddresses(emialAddreses);
35     Messaging.sendEmail(new Messaging.SingleEmailMessage[] { mail });
36 }
37 }

}

```

Day 7:

Lightning Web Components

Lightning Web Components (LWC) is a stack of modern lightweight frameworks built on the latest web standards. It is a DOM (Document Object Model), element created through reusable code and is used to generate a dynamic interface without using JavaScript or building a Library. This feasibility makes it quick and seamless, saving the developers a ton of time and effort on the Web Stack. Let's look at some of its remarkable features:

- Improved performance of the component as most of the code is recognized by the native web browser engine and web stack
- Ability to compose applications using smaller chunks of code since the crucial elements that are required to create a component is part of the native web browser engine and web stack
- Increase in the robustness of the applications built using LWCs as they are inclusive of

- the said modern web standards.
- Parallel interoperability and feasibility to use both Lightning Web Components and Aura components together in the applications with no visible differentiation to the end-users

(i)Create College DataTable Component(APEX CLASS)

Here we are going to create the college data table, for this we need to create an apex class, from which we are going to retrieve the data and Html, javascript files for UI .

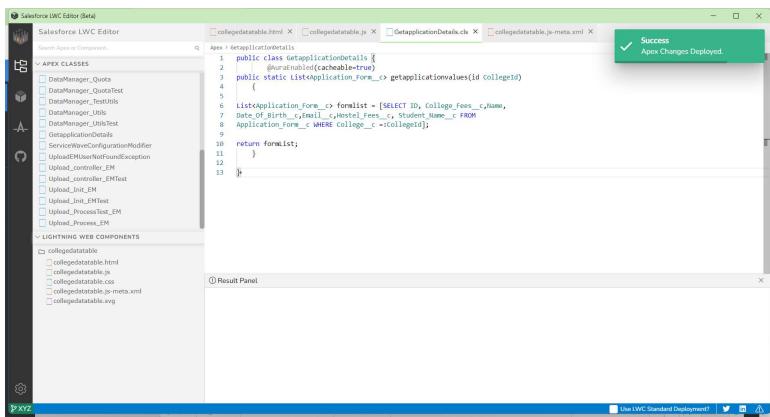

Create an Apex Class With The Required Functionality

```
public class GetapplicationDetails
{
    @AuraEnabled(cacheable=true)
    public static List<Application_Form__c> getapplicationvalues(id Collegelid)
    {

        List<Application_Form__c> formlist = [SELECT ID, College_Fees__c, Name,
        Date_Of_Birth__c, Email__c, Hostel_Fees__c, Student_Name__c FROM
        Application_Form__c WHERE College__c =:Collegelid];

        return formList;
    }

}
```

Day 8:

(ii) Create College DataTable Component (HTML FILE)

Create the component with the following files.

HTML:

```

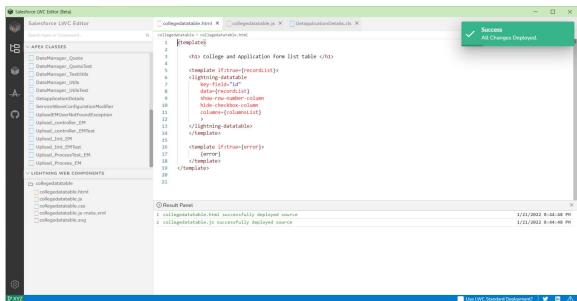

<template>

    <h1> College and Application form list table </h1>

    <template if:true={recordList}>
        <lightning-datatable
            key-field="id"
            data={recordList}
            show-row-number-column
            hide-checkbox-column
            columns={columnsList}
        >
        </lightning-datatable>
    </template>

    <template if:true={error}>
        {error}
    </template>
</template>

```

Day 9:

(ii)

Create College DataTable Component(JAVA SCRIPT FILE)

After the creation of the Html file create the following js file

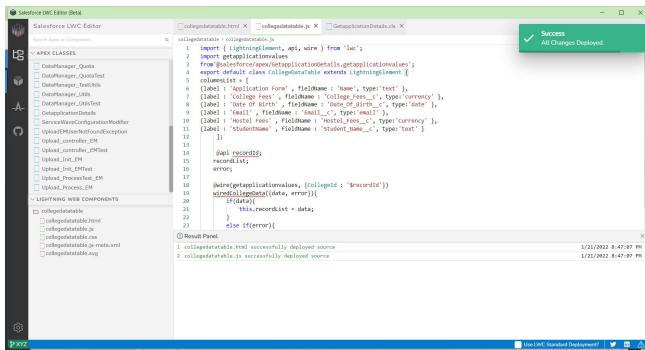

```

import { LightningElement, api, wire } from 'lwc';
import getapplicationvalues
from '@salesforce/apex/GetapplicationDetails.getapplicationvalues';
export default class CollegeDataTable extends LightningElement {
    columnsList = [
        {label : 'Application Form' , fieldName : 'Name', type:'text' },
        {label : 'College Fees' , fieldName : 'College_Fees__c', type:'currency' },
        {label : 'Date Of Birth' , fieldName : 'Date_Of_Birth__c', type:'date' },
        {label : 'Email' , fieldName : 'Email__c', type:'email' },
        {label : 'Hostel Fees' , fieldName : 'Hostel_Fees__c', type:'Currency' },
        {label : 'StudentName' , fieldName : 'Student_Name__c', type:'text' }
    ];

    @api recordId;
    recordList;
    error;

    @wire(getapplicationvalues, {CollegelId : '$recordId'})
    wiredCollegeData({data, error}) {
        if(data) {
            this.recordList = data;
        }
        else if(error) {
            this.error = error;
        }
    }
}

```

Day 10:

(iii) Create College DataTable Component(META FILE)

Change the Meta File as follows:

```
<?xml version="1.0"?>
<LightningComponentBundle
    xmlns="http://soap.sforce.com/2006/04/metadata">
    <apiVersion>51.0</apiVersion>
    <isExposed>true</isExposed>
    <targets>
        <target>lightning__RecordPage</target>
        <target>lightning__AppPage</target>
        <target>lightning__HomePage</target>
    </targets>
</LightningComponentBundle>
```
